MIN-R S Film

1) Description
MIN-R S Film, catalog number 151 3381 (18 x 24 cm) / 173 2726 (24 x 30 cm), is a medium speed, dual coated, ortho-sensitive medical x-ray film for mammographic use with single green-emitting intensifying screens. It is coated on a blue, approximately 0.2 mm (7-mil) polyester base support. MIN-R S Film provides high contrast required to view the breast tissue effectively. MIN-R S Film is intended for standard cycle processing. This film provides high contrast with very low sensitivity to varied processing conditions.

2) Safelight
Use a Ruby Red Safelight Filter (wavelength > 520nm), such as GBX-2, with a frosted 7.5-watt bulb located at least 1.22 meters (48 inches) from the film.

3) Storage and Handling
Handling -
X-ray film is extremely sensitive and prone to handling artifacts. Hands must be clean, dry and free of lotions, etc. Film should be handled carefully by the edges to avoid physical strains such as pressure, creasing, or buckling. Luminous watches, cell phone and darkroom light leaks should be avoided.

Storage -
Store unexposed film at 10–24 °C (50–75 °F), at 30–50 percent RH, and properly shielded from x-rays, gamma rays, or other penetrating radiation. Keep exposed film in a cool, dry place that is properly shielded from penetrating radiation. Process as soon as possible after exposure. Processed film should be stored at 16–27 °C (60–80 °F), and at 30–50 percent RH.
4) Relative Film Systems Speed

Screen-Film Characteristics

\[^a\]This data is representative of films processed in processors recommended for mammography film processing. See the Dedicated and Non-Dedicated Processing Environments sections for listings of those processors.

This data is relative to previously published data for other Carestream Health mammography screen film systems.

5) Sensitometric Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relative Speed</td>
<td>Measured at a density of 1.00 above gross fog.</td>
</tr>
<tr>
<td>Contrast</td>
<td>Measured as slope of the line between densities of 0.25 and 2.00 above gross fog.</td>
</tr>
<tr>
<td>Gross Fog</td>
<td>Density of film base plus processing fog.</td>
</tr>
</tbody>
</table>

6) Process Variations

Changes to speed, contrast, and fog as a result of temperature variation from normal are included in GRAPHS Section.

7) Intermix

This film can be processed with intermixes of common medical x-ray films.

Variations of bromide ions in RP X-OMAT Developer cause sensitometric speed effects, included in GRAPH Section.
8) **Automated Processing**

The following tables are for recommended film processors and replenishment rates for MIN-R S Film using RP X-OMAT or X-OMAT EX II Developer and RP X-OMAT LO Fixer.

**Note:** For low use rates, if sensitometry does not stay within control limits, flooded replenishment may be needed. Flooded replenishment is intended to maintain the developer solution at a continuously fresh chemical activity. This is accomplished by replenishing not only when film is fed, but also on the basis of processor on time.

RP X-OMAT Developer Starter is added to the replenishment tanks at the rate of 25 ml per litre, 89 ml per gallon or 3 fl oz per gallon. (Use RP X-OMAT Developer Starter only.) Fill the processor tanks with the solution from the replenishment tank. However, do not add extra starter to the processor developer tank.

For more detailed information on how to set up each processor for Flooded Replenishment, see the Installation or Service manual for each processor. The setup should be done by qualified service personnel.
**DEDICATED PROCESSING ENVIRONMENTS -**

This information is for MIN-R S Film, and MAY NOT APPLY to other Carestream mammography films.

<table>

[1] Flooded replenishment should not be required due to the automatic compensation for use feature, but is available if needed to maintain sensitometry for low use conditions.

[2] If sensitometry does not stay within control limits, flooded replenishment may be needed.

**Notice:** Observe precautionary information on product labels and on the Material Safety Data Sheets.

**Fixer Retention**

The ability to maintain a quality image over several years is dependent on the stability of the image you produce. Image stability begins in the processing cycle. High levels of residual fix (hypo) in processed film indicate insufficient washing, and this can significantly impact the stability of the film. Insufficient washing can be caused by improper wash flow rates, loss of fixer temperature control, inactive fixer, or improper film storage conditions. An analysis of fixer retention in film should be performed quarterly or whenever poor washing is suspected.

**Drying**

Use the lowest possible dryer temperature that will maintain proper film drying. The dryer temperature will vary depending on the processing cycle, the relative humidity, and the environmental temperature, and should be adjusted to meet individual conditions. Different processing cycles will require different dryer temperatures to compensate for varying times that the film is in the dryer section. Refer to the Operator Manual for dryer temperature adjustment instructions.
