## High Definition Color Printing Like Never Before for Medical Imaging

In the field of medical imaging, the usage of color medical prints is increasing. However, getting high-quality color prints continues to be a challenge. Like many radiologists, Dr TBS Buxi, a renowned name in the radiology community, had also been facing this challenge in the past. His search for optimal solution ended with Carestream's *DryView Chroma Imager*. He has been using this product for more than a year now. Dr Buxi shares his experience of using this product and its various benefits for radiologists.

### On challenges of medical color image printing

The major problem radiologists face with respect to color image printer is the quality of prints. Blur prints with unpleasing colors that are not merging well or with lines all over do not serve the purpose. Such prints might show some kind of events but would not truly depict anything in an aesthetic manner. One of the purposes of using color printers is to get prints of such quality that can be used even in text books. Most of the printers available in the market provide low quality prints, which fail to give the

fineness of pathological events and are unfit for text books.

Another challenge is to find a color printer, which can consistently give quality color prints, with maximum uptime of equipment. High-end quality printers also face the challenge of easy availability of paper at reasonable price. All the options to combat this challenge come at an extra cost. Thus, these aspects need to be considered while choosing the printer to avoid getting into any fix. Recently, I have come across Carestream *DryView Chroma Imager* and in my opinion it addresses these challenges.

### On selecting Carestream *DryView Chroma Imager* over other products

The biggest USP of this product that makes it score above other products available in the market is the excellent quality of color prints. Consistent quality of color prints is another USP of this product. For more than two decades I have been using Carestream products and am satisfied with its after-sales services. Carestream's manpower is readily available to ensure maximum uptime of the equipment. The features of this product makes it value for money.

### On modality used most for this printer

I used this printer mostly for CT and MR scan. It is also applied for volume rendering, angiograms, and all sorts of orthopedic reconstructions; all these purposes are aptly and beautifully served through these color-coded prints. I have used many printers before but none of them can match the features

of this printer and thus makes it the most appropriate for all types of medical color prints. DICOM compatibility of this imager with all modalities makes it the preferred choice for all sorts of medical color printing needs.

The product is extremely user-friendly. In fact it is not just easy to use but is also very simple to install. It works on the principle of direct printing, which makes it a one click command product. The functioning of this product is very easy to understand such that that anyone can use it without any discomfort.

### On patient care

High quality color prints from Carestream *DryView Chroma Imager* provide even minute details of the pathological event that has occurred. Better quality prints, providing finer details, definitely come very handy to surgeons for interventions of complex nature. These kinds of color prints are very useful in case of complexities like spinal cord vascular malformations and in providing better understanding to patients as the problem is clearly visible on such prints.

### On suggestions to other radiologists about this product

High color print quality and consistency, easy availability of paper and other parts, user-friendliness, smooth functioning, and easy maintenance are some of the parameters on which radiologists select their imagers. There are many medical color printers available in the market; however, this one gives finest print quality and consistency, while serving all the imaging needs of radiologists. Considering all its features, on the scale of 1 to 10, this product would definitely score 9 or may be 10. For tension-free day-to-day operations, Carestream *DryView Chroma Imager* is the right choice. ■
