Carestream Dental

Dental Intraoral Images in Minutes

- Meets professional needs for ready-to-read radiographs.
- Designed to provide radiographs conveniently, simply and quickly.

Processing Chemicals

- 60 second processing (30-second develop, 30-second fix).
- Room-temperature solutions (70-76 °F) (21-24 °C).
- Ready-to-use, no mixing convenience.
- Compatible with Intraoral Dental films.
- Once opened: For best results always tighten cap, store between 5-20 °C, and use within 15 days.

Ready-to-Use

Just pour and process. Radiographic processing takes place in solutions that are at room temperature.

Solution/Step	Temperature	Time	Agitation
Dental	72 °F (22 °C)	30-45 seconds	Continuous
Carestream Fixer	60 to 85 °F	Minimum of 30-45 seconds	Continuous
Wash	60 to 85 °F	30-45 seconds	Running water

Note: Discard developer and fixer after processing the equivalent of 60 intraoral films (size 2-film) in 5 ounces (148 mL) of solution or after one day, whichever comes first. Keep developer covered to reduce the rate of oxidation, evaporation and contamination.

It should be recognized that while processing fulfills the need for quick information, it is often at the expense of image quality. Such films are frequently fogged, have poor image density and contrast, and will eventually discolor. If you plan to keep the radiographs, re-fix the films for 2-4 minutes in Carestream Fixer or GBX fixer solution and re-wash in running water for 10 minutes.

Note: The Developer has inherent color variability due to the headspace (air) in the bottle during the manufacturing process, Oxidation occurs when the developer is exposed to heat and air. The solution contains antioxidants to combat this, and slight color variation is acceptable

Ordering Information

Description	Nominal Size	REF No
CARESTREAM DENTAL DEVELOPER	12 X 500 ML	6850051
CARESTREAM DENTAL FIXER	12 X 500 ML	6850069
